Task 01:

Document Q&A Bot using RAG.

Problem Statement

Build a system that answers questions from a folder of documents (policies, FAQs, manuals, SOPs).

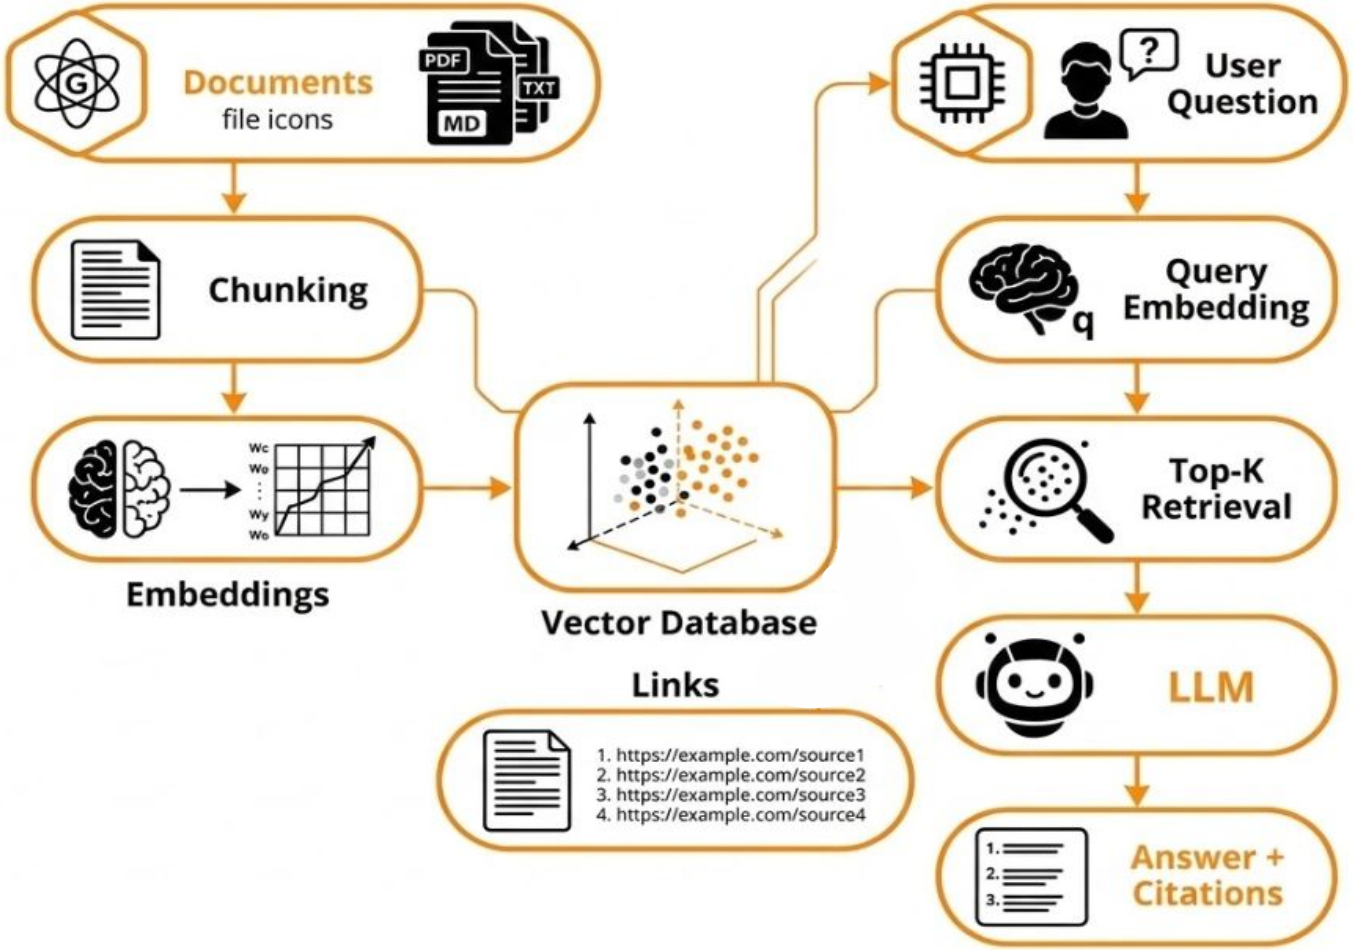
The system must:

Search documents and retrieve relevant info.

Answer using content provided, with proper citations.

Architecture

The Visualisation of our approach and process

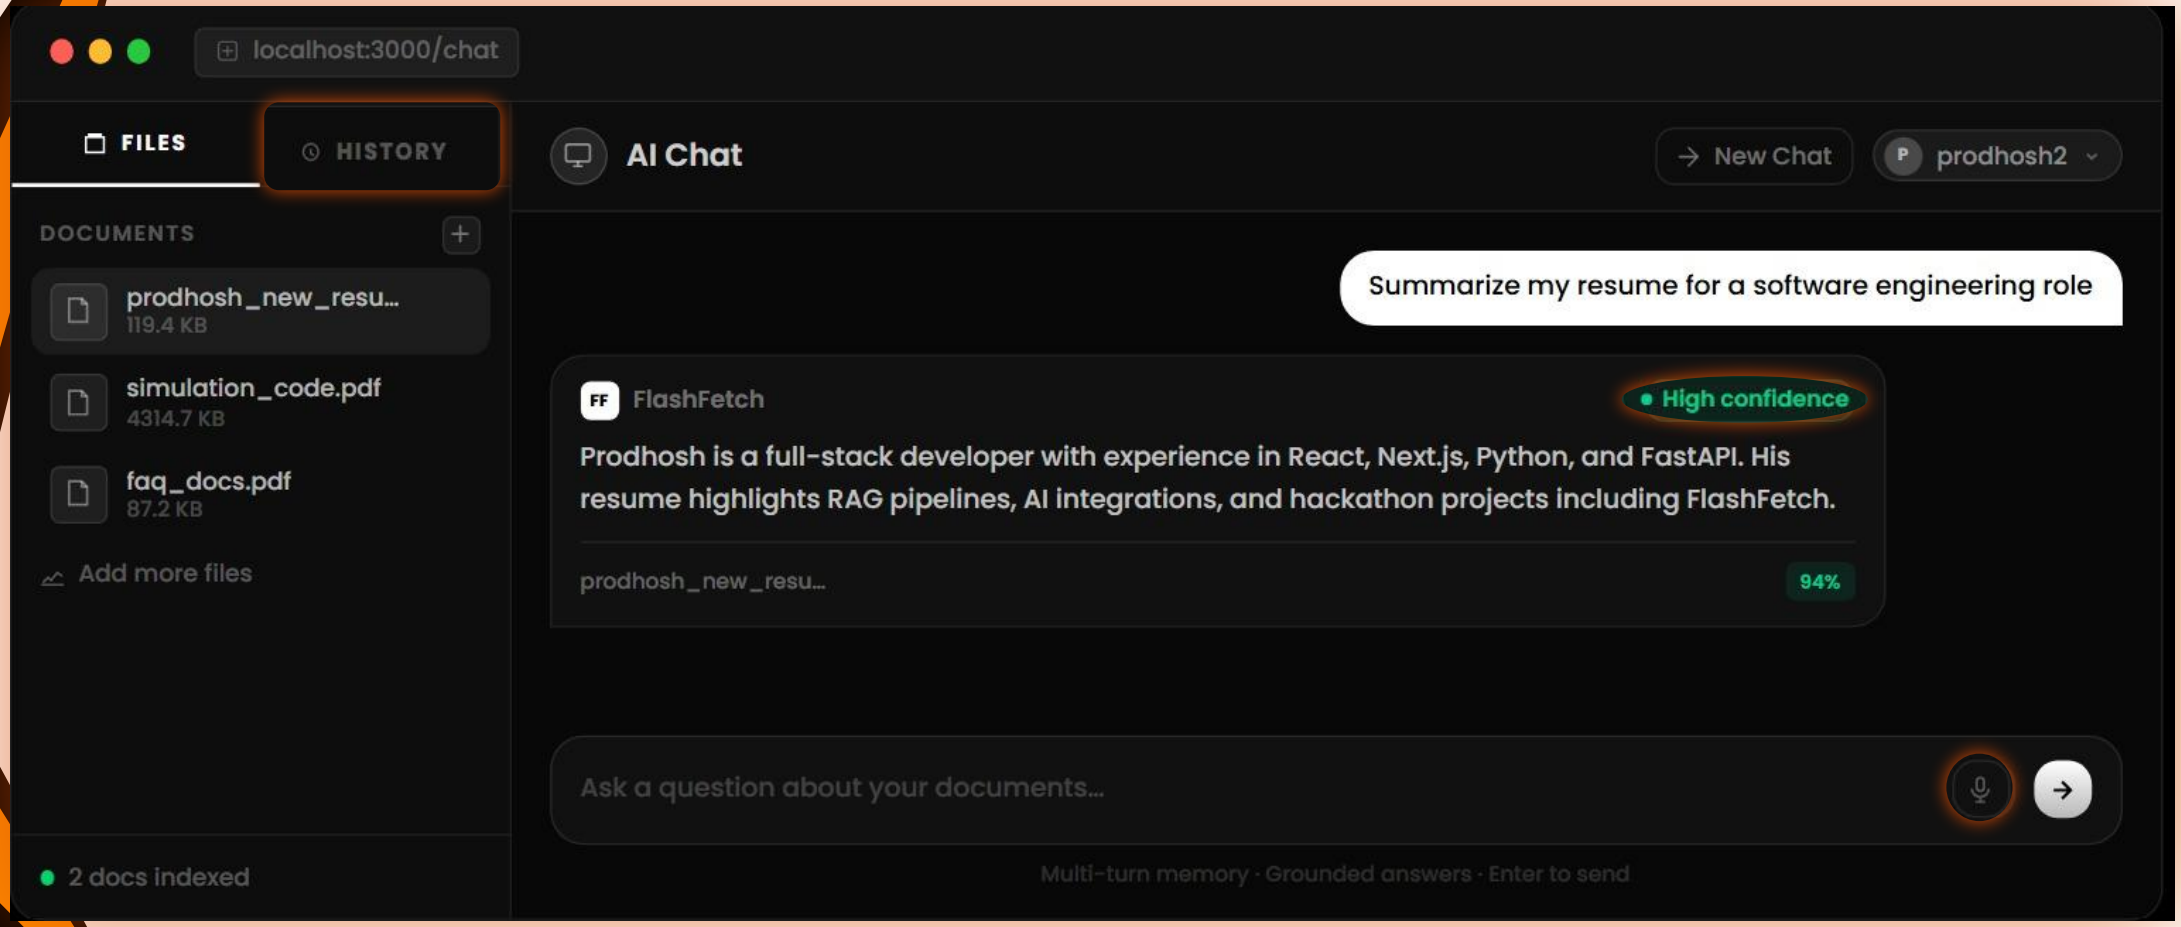


Code Highlights

```python
# — System prompt ————————————————————————————————————————
system_prompt = (
    "You are a strict document Q&A assistant. "
    "Rules you MUST follow:\n"
    "1. Answer ONLY using the provided document context — no outside knowledge.\n"
    "2. Be direct and concise. Avoid padding or filler phrases.\n"
    "3. You may use the previous conversation for context, but base answers on the documents.\n"
    "4. If the exact answer is not in the context, respond EXACTLY with: "
    f'"{NO_ANSWER}"\n'
    "5. Never guess, infer beyond what is written, or fabricate details.\n"
    "6. IMPORTANT: Detect the language of the user's question and respond in that SAME language. "
    "If the question is in Tamil, answer in Tamil. Hindi → Hindi. Telugu → Telugu. "
    "English → English. Match the user's language exactly."
)
```

```python
NO_ANSWER = (
    "I could not find this in the provided documents. "
    "Can you share the relevant document?"
)
```

Chat Interface



Features:

1. MultiLingual Support
2. Voice to text feature
3. Peer Link Sharing
4. Confidence based evaluation
5. Citation inclusion
6. History view option
